values show: **mean** ±sd (min - max) and are all based on measurements of melanopic EDI (lx)

[1] Histogram limits are set from 00:00 to 24:00

[2] Metrics are calculated on a by-participant-day basis (n=88) with the exception of IV and IS, which are calculated on a by-participant basis (n=15).

[3] Values were log 10 transformed prior to averaging, with an offset of 0.1, and backtransformed afterwards
